*Allowable Subject Matter*

1. The request for continued examination (RCE) and amendments submitted with the filing of the RCE on 24 May 2004 have been received and entered.
2. Claims 1, 12 and 22-26 have been cancelled by the applicant. Claims 2-11, 13-21, 27 and 28 are allowed.
3. The following is an examiner's statement of reasons for allowance:

The present invention teaches a schedule management system including an internal server for a managing party and a public web server accessible by one or more managed parties. Each independent claim identifies the distinct feature of an internal server for a managing party and a public web server accessible by one or more managed parties, with the internal server and the public web server being connected via a first network and the public web server and managed parties being connected via a second network comprising "a common schedule table provided on the public web server, the common schedule table storing the schedule transferred from the internal server via the first network, enabling means provided on the public web server for enabling the managed parties to refer to the schedule stored in the common schedule table via the second network, receiving means provided on the public web server, the receiving means receiving modification data addressed to the public web server from one or more of the managed parties via the second network, an input database provided on the public web server for storing the modification data, and extracting means provided on the public web server for extracting

Art Unit: 2173

from the input database the modification data for transfer thereof to the internal server via the first network”, wherein “the internal server is further configured to reject data addressed to the internal server from the managed parties”. The closest prior art, O’Brien U.S. Patent 6,587,831, teaches an online scheduling system where schedules are created and managed by a host server communicating with client machines. The prior art fails to teach “a common schedule table provided on the public web server, the common schedule table storing the schedule transferred from the internal server via the first network, enabling means provided on the public web server for enabling the managed parties to refer to the schedule stored in the common schedule table via the second network, receiving means provided on the public web server, the receiving means receiving modification data addressed to the public web server from one or more of the managed parties via the second network, an input database provided on the public web server for storing the modification data, and extracting means provided on the public web server for extracting from the input database the modification data for transfer thereof to the internal server via the first network”, wherein “the internal server is further configured to reject data addressed to the internal server from the managed parties”, where communication between the internal server and the public web server are separated from the communication between the public web server and the managed parties, through the two networks. Therefore, the prior art fails to anticipate or render the above limitations obvious.
